

Crystal Data: Cubic. *Point Group:* $4/m\bar{3}2/m$. Fine-grained, as intergrowths with novákite.

Physical Properties: *Tenacity:* Malleable. Hardness = ~ 4.5 VHN = 237–270 (25 g load). D(meas.) = 8.38(7) (synthetic). D(calc.) = 8.400

Optical Properties: Opaque. *Color:* Silvery gray; in polished section, grayish white to pale blue-gray. *Luster:* Metallic.

R: (400) 49.6, (420) 48.8, (440) 48.0, (460) 46.8, (480) 45.6, (500) 44.5, (520) 43.5, (540) 42.6, (560) 42.0, (580) 41.4, (600) 41.1, (620) 40.8, (640) 40.5, (660) 40.4, (680) 40.5, (700) 40.9

Cell Data: *Space Group:* $Pm\bar{3}m$. $a = 11.78079(2)$ (synthetic). $Z = 4$

X-ray Powder Pattern: Černý Důl mine, Czech Republic. 2.259 (100), 2.078 (100), 2.702 (90), 2.398 (80), 1.991 (70), 1.959 (70), 1.776 (70)

Chemistry:	(1)	(2)	(3)
Cu	43.68	43.89	43.16
Ag	31.63	31.63	31.40
As	25.16	24.26	25.44
Total	100.47	99.78	100.00

(1) Černý Důl mine, Czech Republic; by electron microprobe. (2) Wasserfall, France; by electron microprobe. (3) Cu₁₄Ag₆As₇.

Occurrence: In carbonate-rich hydrothermal veins (Černý Důl mine, Czech Republic).

Association: Novákite, koutekite, paxite, arsenolamprite, löllingite (Černý Důl mine, Czech Republic); allargentum, koutekite, domeykite (Wasserfall, France); koutekite, domeykite (Meskani, Iran); paxite, lautite, arsenic, silver, löllingite, proustite (Niederbeerbach, Germany).

Distribution: From the Černý Důl mine, Krkonoše (Giant Mountains), Czech Republic [TL]. At Wasserfall, about 20 km northwest of Belfort, Haute-Saône, France. From Mühlthal, Niederbeerbach, Odenwald, Hesse, Germany. At the Meskani mine, Anarak district, Iran. In the East Arm area, Great Slave Lake, Northwest Territories, Canada.

Name: For Dr. Jan Kutina (1924–), Lecturer at the Charles University, Prague, Czech Republic.

Type Material: Charles University, Prague, Czech Republic, 14428; Yale University, New Haven, Connecticut, USA.
